Risk Intelligence at Your Fingertips with the OnSolve Mobile App

Today's workforce is more mobile than ever. Your employees are traveling far and wide for everything from daily task completion to important customer meetings to help drive successful outcomes for your organization. With increased mobility, uncertainty can arise. It's important to do everything you can to ensure the safety and security of your employees as they travel to and work in destinations around the world.

With the OnSolve® Risk Intelligence mobile app, you'll keep your mobile employees safe and more informed. The app is a powerful device for organizations that want to mitigate risks for their employees with the ability to constantly monitor for critical events and send alerts at moment's notice when issues arise in their area. You can work with greater confidence and more localized situational awareness to make better decisions about how to best protect your employees and your business operations in the face of disruptions and challenges in the field.

New and Enhanced Features

Geolocation-based Visibility

The locations of mobile users can be seen by peers using the app and/ or corporate teams in charge of risk management. This means that employees will be notified of only those events that are nearby their location and when they're in need of assistance, their organization can get to them quickly.

Simplified Communication

By combining risk information with employee locations, communications such as team check-ins, messaging and emergency alerts are streamlined and accessible. This makes it easier to conduct a coordinated effort across mobile employees when issues are encountered.

Growing Global Coverage

OnSolve Risk Intelligence has data coverage and alert capabilities in all countries around the globe and language capabilities continue to grow and diversify as more sources, global to localized, are evaluated. This supports more granular alerting wherever your mobile workforce is located.
Precise Location Sharing

Location sharing within the mobile app can enable employees to ask for help quickly in an emergency. By knowing their location, assistance can be coordinated quickly and effectively with local teams.

What makes our mobile app different?

- **Privacy-enabled:** Mobile users have the option to "ghost" their location, obscuring their exact coordinates from peers and security staff. Users can still receive alerts for nearby events, but their location is randomized within a 10 km radius, or 100 square miles.

- **Interactive:** The mobile app puts the power in the user's hand, allowing them to report critical events, validate online reports, chat with others and automatically alert their emergency contacts with the tap of a button.

- **Context-driven:** By overlaying risk information with employee locations, we can automatically warn employees if the security context changes while they're in transit. When a mobile user enters an area where we've detected a critical event, they can receive an alert, aiding in their ability to proactively find safety.

OnSolve Benefits

As the mobile workforce continues to grow, it's important to have a plan in place for staying connected and informed in times of crisis. The OnSolve Risk Intelligence mobile app puts the power of an AI-driven solution for risk mitigation and organizational resilience in the hands of your employees in the field.

Fast, relevant, actionable intelligence that puts you in control.
